

KENNER CHAIN WALL®
Modular Precast Concrete Foundations

CASE STUDY - Telecom

Installed Here!

Relocated Here!

Picture It! Louisiana Flood Risk - A Kenner Chain Wall and equipment shelter were installed as planned shown in the photo on the bottom left. The next day it was determined that the shelter had to be moved due to a right-of-way restriction. The contractor ordered a second Kenner Chain Wall since the normal procedure for a situation like this is to abandon the foundation and pour a new foundation. The Kenner Chain Wall team declined the order, then informed the client that the precast chain wall, just like the prefabricated shelter, could easily be relocated. The following week, both the shelter and chain wall were repositioned on the other side of the tower as shown in the photo bottom right.

The Kenner Chain Wall is a patented Modular Foundation System used to elevate Transformers, Control Buildings, Electrical Substations, Data Centers, Energy Storage, Pipeline Monitoring Stations, Cooling Towers, Equipment Shelters, Generators and more. This patented system is available for Seismic or Non-Seismic applications. Kenner Chain Walls arrive ready for immediate installation! Kenner is partnered with multiple certified precast facilities, who manufacture all Chain Wall units.
